Environmental Benefits of the Conservation Reserve Program

2016

Chesapeake Bay Basin

<u>Fiscal Year</u>		2011	2012	2013	2014	2015	2016
Land Enrolled*	1,000 acres	300	287	266	248	236	221
In Wetlands	1,000 acres	6	6	6	6	6	5
Buffers	1,000 acres	105	105	101	97	95	88
Reductions (intercepted by buffers or not leaving field) **							
Sediment	million tons	11	11	11	10	10	9
Nitrogen	million lbs.	27	26	25	23	22	21
Phosphorus	million lbs.	7	7	6	6	6	5
Greenhouse Gas	Mil. metric tons		0.4	0.4	- -	- -	
Reduction **	CO2 equivalent/yr.	0.6	0.6	0.6	0.5	0.5	0.5

*Cumulative acres. ** Annual estimate, see Estimation Methodology.

- CRP reduces the nitrogen and phosphorus leaving a field in runoff and percolate. Nitrogen and phosphorus leaving CRP fields are 95 and 86 percent less, respectively, compared to land that is cropped.
- Grass filter strips and riparian buffers intercept sediment, nitrogen, phosphorus, and other contaminants, before they enter waterways. Because buffers both reduce contaminants on the land they occupy and intercept contaminants from other lands they have disproportionate water quality benefits.
- Using models developed by the Food and Agricultural Policy Research Institute (FAPRI), CRP reduced nutrient losses in 2016, by an estimated 21 million pounds of nitrogen and 5 million pounds of phosphorus, compared to land that is cropped. Sediment losses were reduced by an estimated 9 million tons.
- Upstream CRP lands reduce downstream flood damage. Peak flows are reduced by slowing, storing, and infiltrating storm water runoff.
